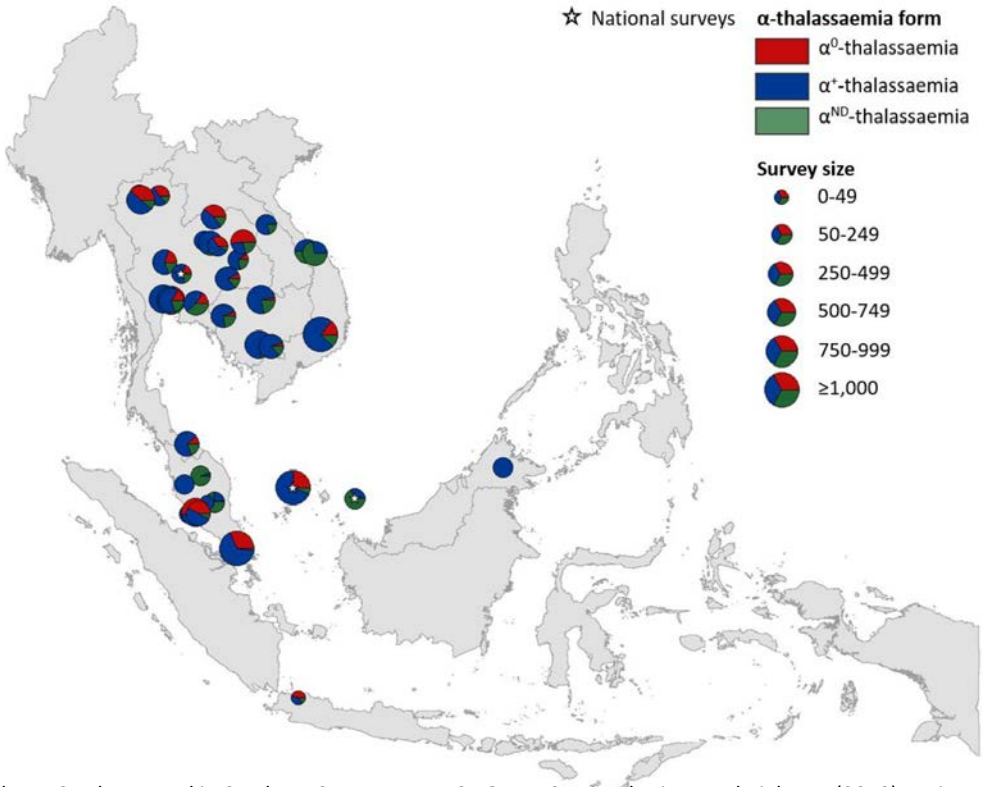
THAILAND

Thalassemia distribution in Thailand



Hockham, C., Ekwattanakit, S., Bhatt, S., Penman, B.S., Gupta S., Viprakasit V. and Piel, F.B. (2019). Estimating the burden of α-thalassaemia in Thailand using a comprehensive prevalence database for Southeast Asia eLife 8:e40580.

40-50% of the Thai population are carriers of at least one of these abnormal genes*

α-thalassemia is at about 20–40%
β-thalassemia is at 3–9%

Variant types

1. Single nucleotide variants (SNVs)
2. Small insertions/deletions (InDels)
3. Copy number variants (CNVs)

Thalassemia **prevention** and control programs were introduced using **post conception screening in couples** and **prenatal diagnosis (PND)** for the prevention of new thalassemic births.

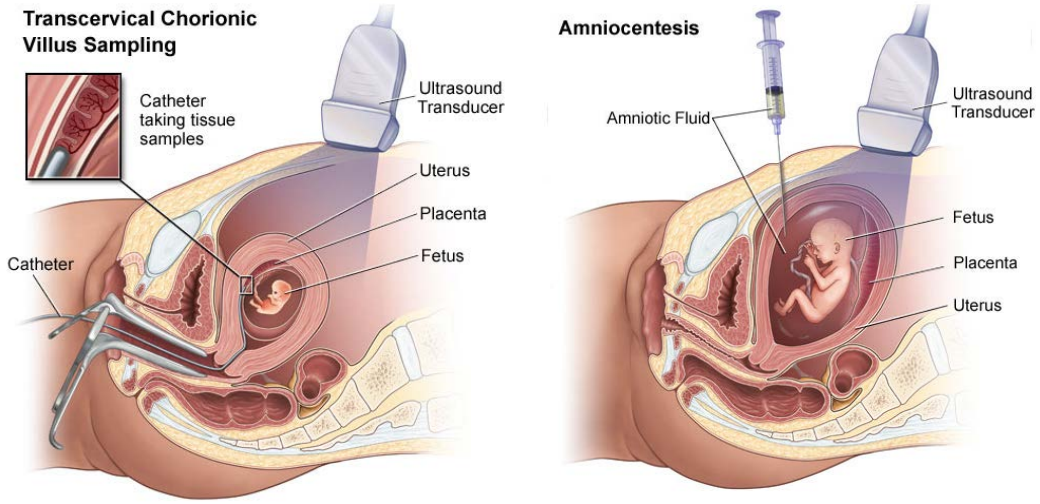
Prenatal screening

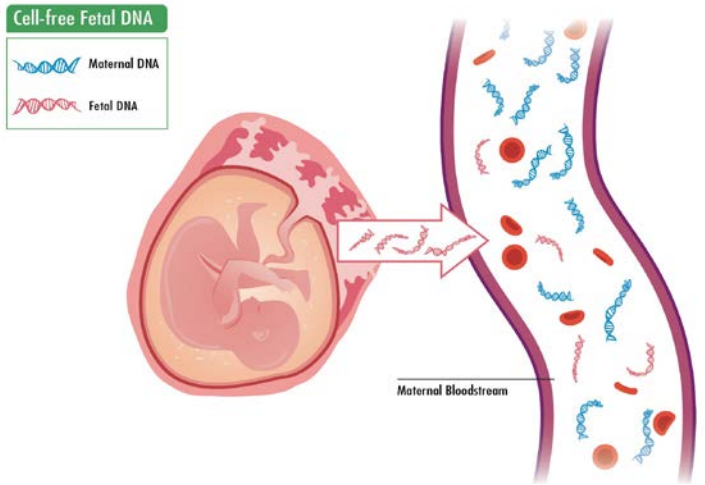
Traditional method (Invasive)

is the most commonly used to **diagnose** chromosomal abnormalities.



Non-Invasive Prenatal Testing (NIPT)

is a **screening** that helps to detect the presence of some genetic diseases and anomalies in the fetus before birth from **cell-free fetal DNA in mother's blood**.



Comparison between traditional method and NIPT

Characteristic	Amniocentesis	NIPT
Objective	For diagnosing To confirm/rule out genetic problems	For screening To evaluate the risk of problems
Type	Invasive procedure	Non-invasive
Miscarriage	1-2% risk	None
Time	> 17^{th} weeks of pregnancy	> 10^{th} weeks
Sample	Amniotic fluid	Mother blood

Non-Invasive Prenatal Testing (NIPT) for screening of genetic disorders in fetal

1. Chromosomal disorders

- Down Syndrome (Trisomy 21)
- Edwards Syndrome (Trisomy 18)
- Patau Syndrome (Trisomy 13)

2. Disorders found in the sex chromosome (X and Y)

- Jacobs Syndrome (XYY)
- Turner Syndrome (Monosomy X)
- Klinefelter Syndrome (XXY)
- Triple X Syndrome (Trisomy X)
- XXYY Syndrome

3. Disorders caused by some gene sequences (microdeletions)

- Smith-Magennis Syndrome
- DiGeorge Syndrome
- 1p36 deletion Syndrome
- Wolf-Hirschhorn Syndrome

4. Some of the nearly 100 monogenic disorders

- Alpha-thalassemia (α-thalassemia)
- Beta-thalassemia (β-thalassemia)
- Sickle cell anemia
- Cystic fibrosis
- Gaucher's disease
- Phenylketonuria
- etc..

Genetic testing of thalassemia – carrier screening and NIPT

Medicover Genetics Editorial Team | January 4, 2023

Derived from the Greek words for sea (θάλασσα) and blood (αίμα), thalassemias are a group of inherited, genetic blood disorders. Thalassemias occur when the production of hemoglobin, a protein that carries oxygen within the red blood cells (RBCs) is disrupted. A life-threatening disease, thalassemia is an autosomal recessive condition with over 100,000 affected babies being born every year [1].

Familial Mediterranean fever: a

OVERVIEW

WHAT IS VERAGENE

VERAgene is the only non-invasive prenatal test that can simultaneously screen for aneuploidies, microdeletions and single gene diseases. The diseases screened by VERAgene are associated with moderate to severe phenotype with significant impact on the quality of life. By combining detection of aneuploidies and microdeletions with the screening of monogenic diseases, VERAgene provides a comprehensive solution to prospective parents.

HOW IT WORKS

VERAgene needs a maternal blood sample, and a buccal swab sample from the biological father. The maternal blood contains cell-free DNA from both the mother and the fetus. This cell-free DNA is isolated and analyzed along with the father's DNA sample for any potential genetic mutations using next generation sequencing. Sophisticated bioinformatics algorithms are then used to compute the risk of the fetus having a monogenic disease.

The results are sent to the clinician who communicates them to the parents and provides the necessary counseling.

Cost and turnaround time of PBH-NIPT

Task	Estimated cost per sample	Turnaround time
Cell-free DNA extraction and QC	~$5 (173 THB)	~0.5 day
Library preparation and QC	~$15 (517.70 THB)	~0.5 day
Hybridization capture and QC (8 indexed libraries pooled into one sequencing library)	~$30 (1035.39 THB)	~2 days
Sequencing	~$25 (862.83 THB)	~2 days
Data analysis	~$5 (173 THB)	~1-2 days
Total	**~$80 (2761.04 THB)**	**~7 days**

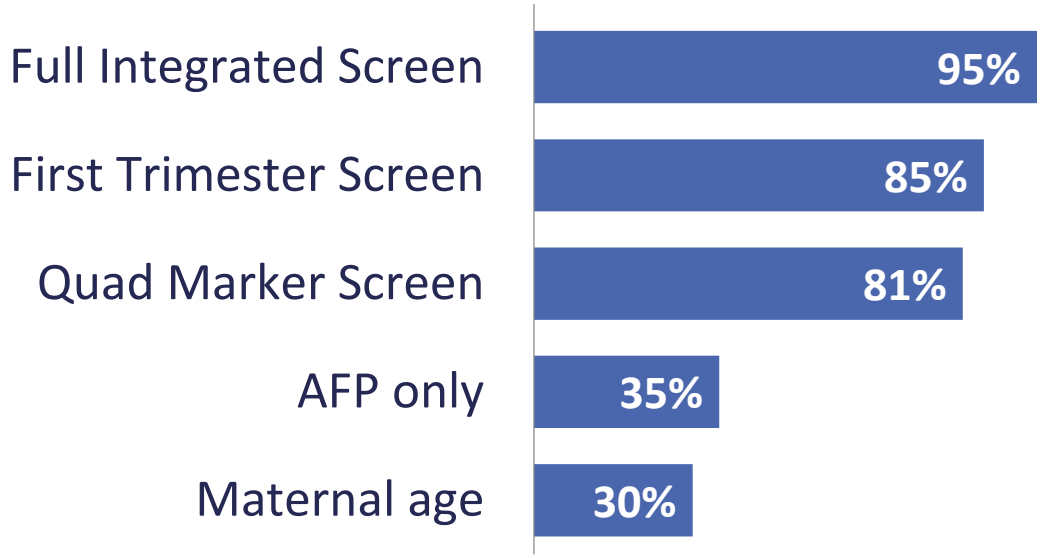
We can not PND 800 cases to get one case

Detection rate for Down syndrome Using Current Recommendation

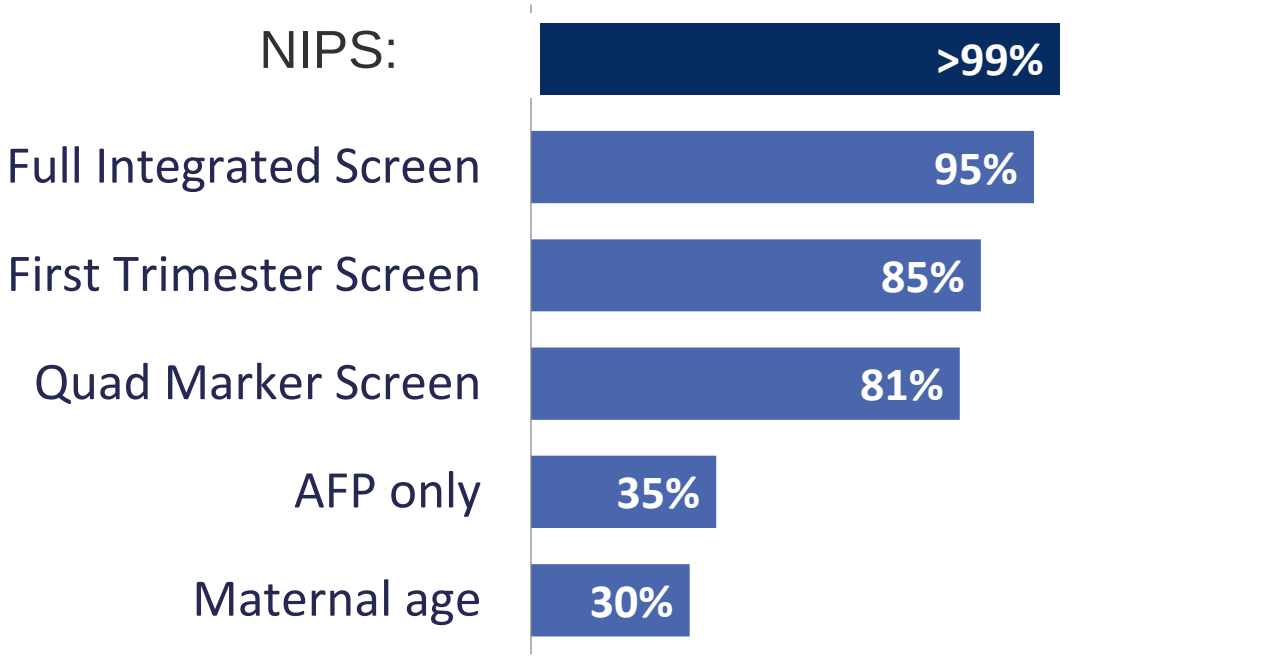
Detection rate for Down syndrome



False positive rate for conventional screening: 5%

ACOG Practice Bulletin No. 77. Obstet Gynecol 2007;109:217-27.

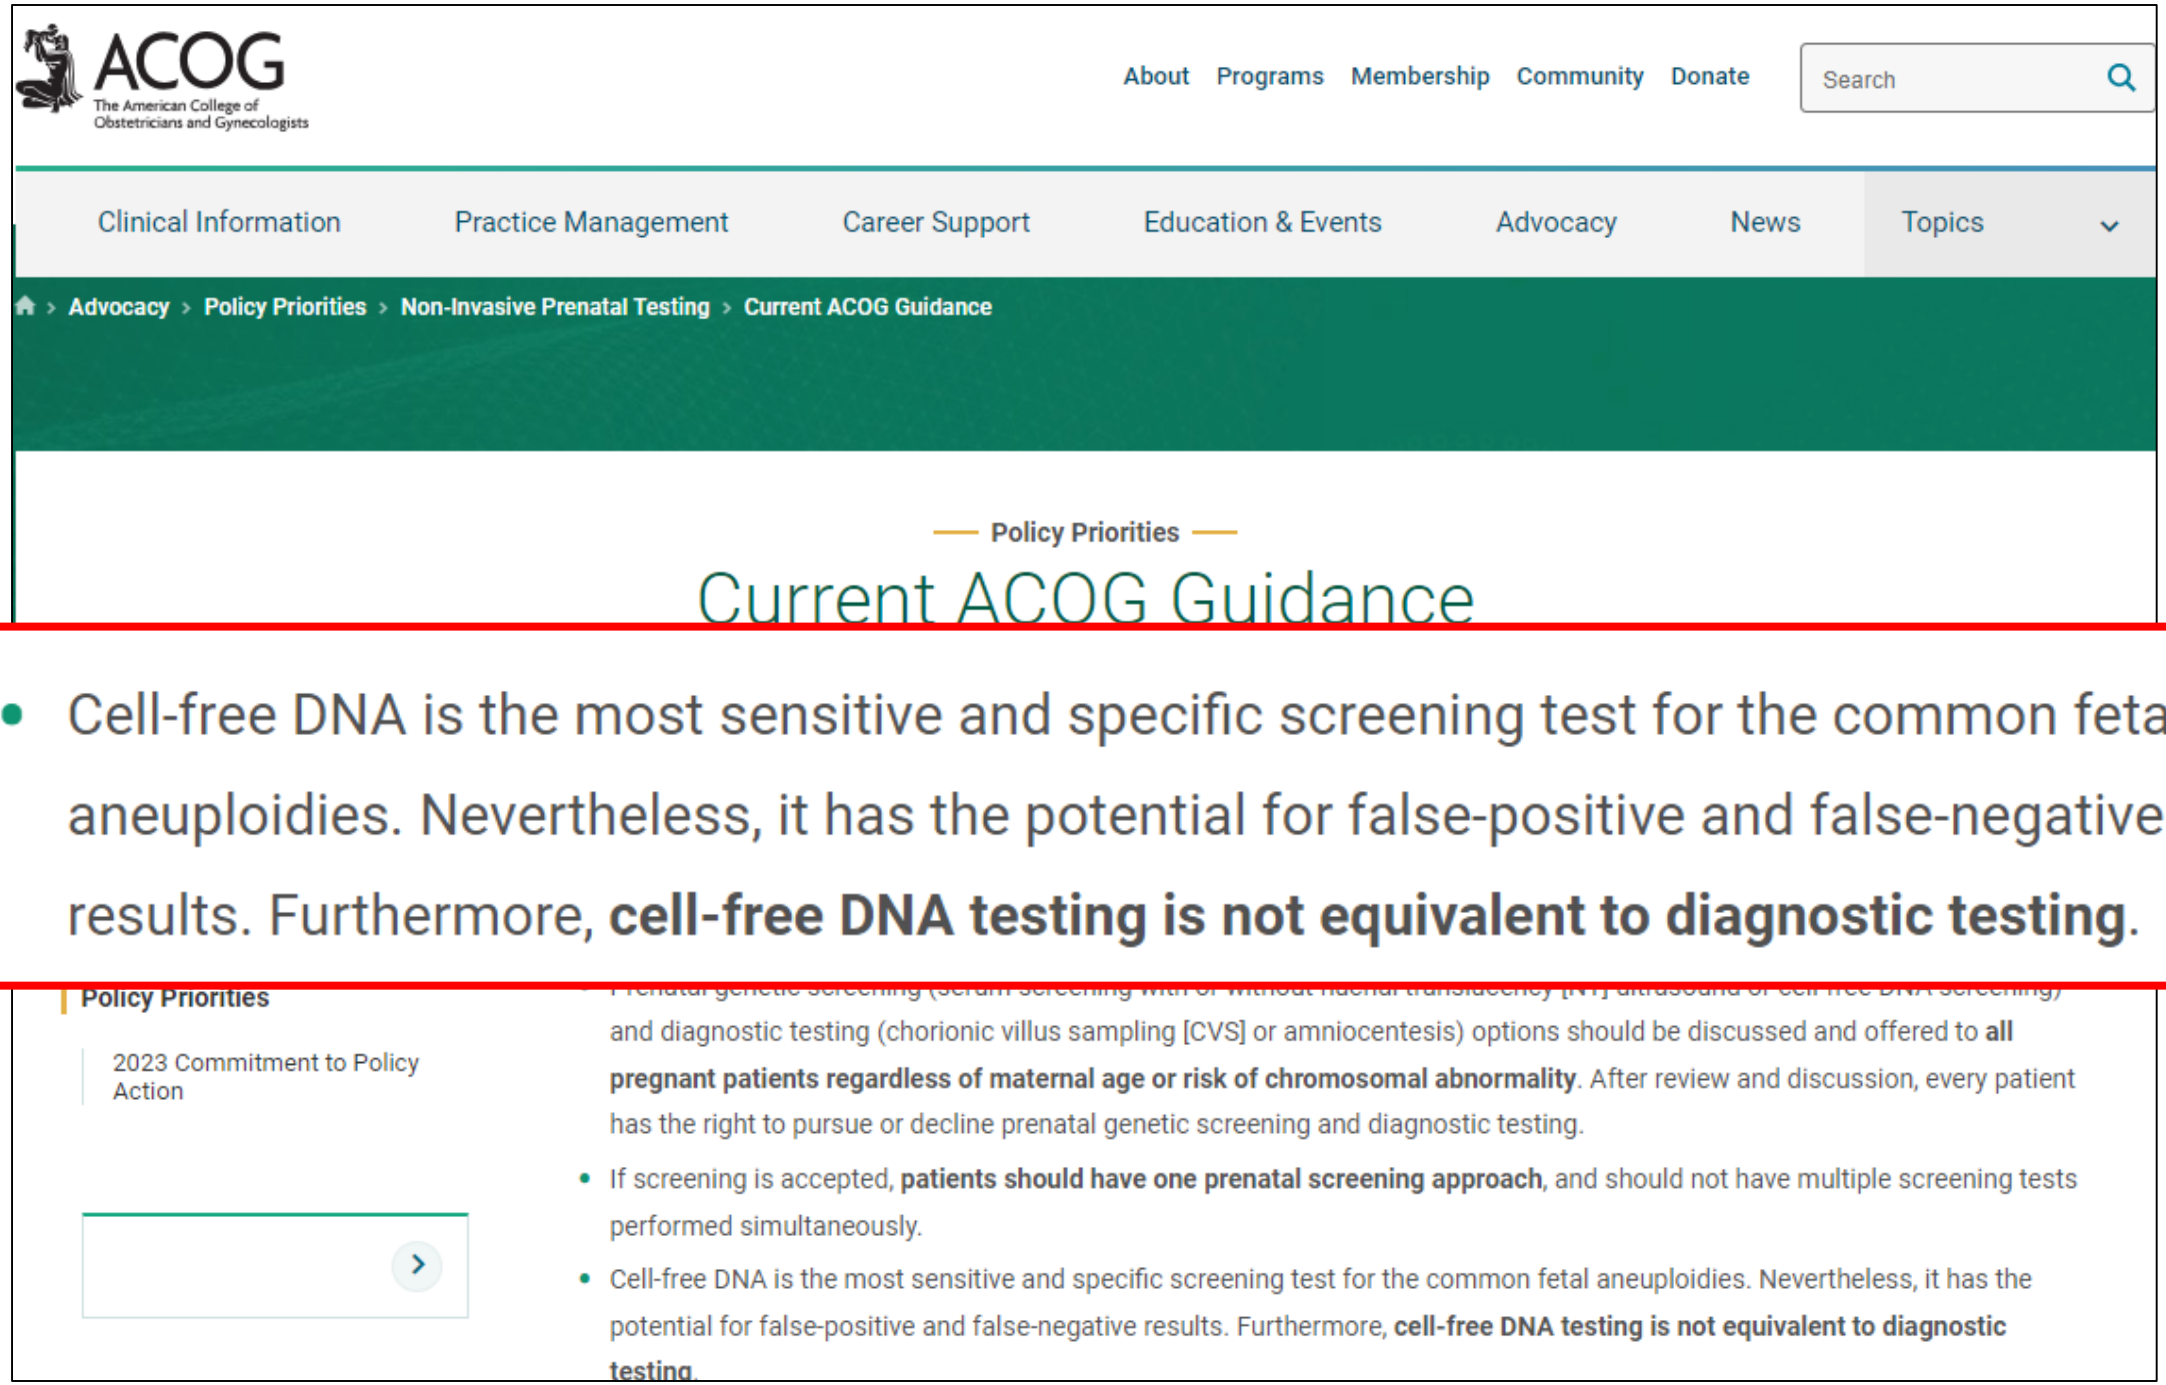
Detection rate for Down syndrome Using NIPS



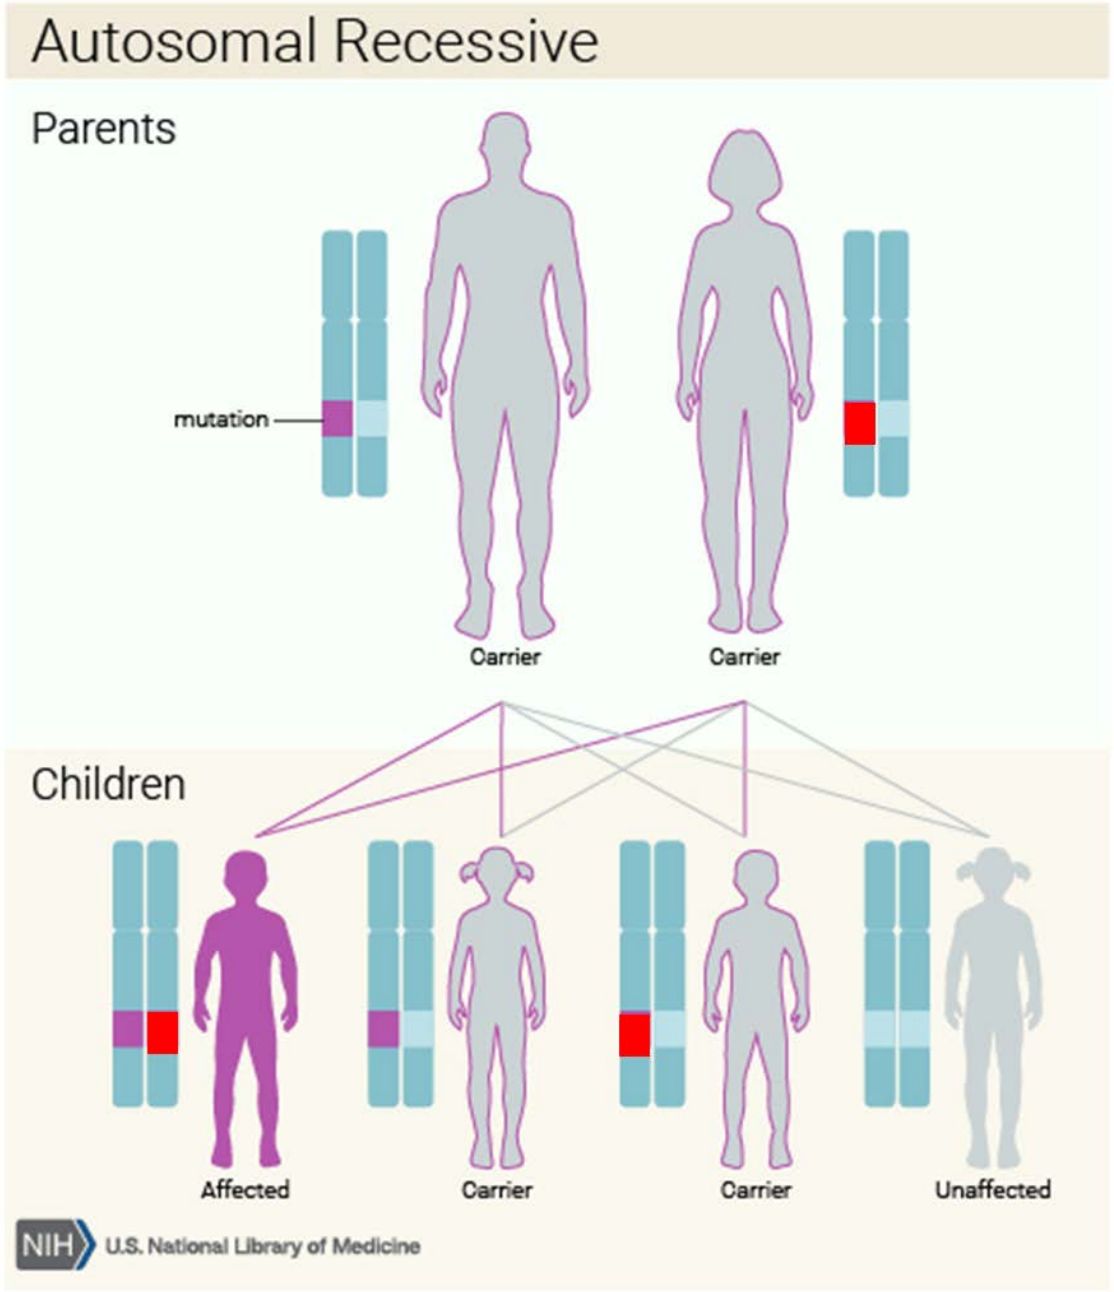
False positive rate for NIPT : < 0.1%

ACOG Practice Bulletin No. 77. Obstet Gynecol 2007;109:217-27.

NIPS: Non-Invasive Prenatal Screening



- Cell-free DNA is the most sensitive and specific screening test for the common fetal aneuploidies. Nevertheless, it has the potential for false-positive and false-negative results. Furthermore, **cell-free DNA testing is not equivalent to diagnostic testing**.



Why there is no room for NIPT for thalassemia ?

- Risk for thalassemia syndrome ranges from 25% to 50% (not 1 in 800 or 1 in 2000)
- PPV and NPV: unknown ?
- False positive: unknown ?
- False negative: unknown ?

Principles of Screening:

1. The disease should be an important public health problem in terms of its frequency and/or severity

2. The natural history of the disease presents a window of opportunity for early detection

3. An effective treatment should be available that favorably alters the natural history of the disease

4. A suitable screening test should be available, that is, one that is accurate, acceptable to the population, fairly easy to administer, safe, and relatively inexpensive

WHO Guideline 2020

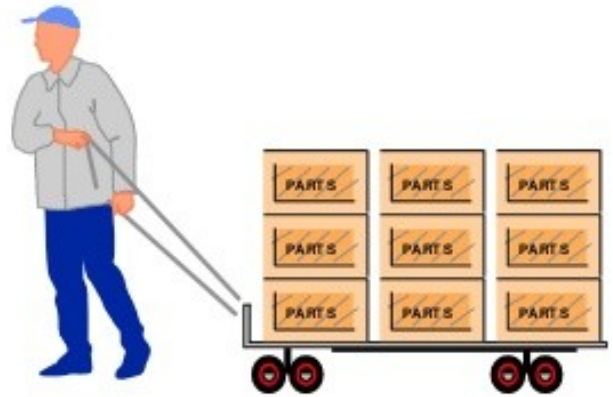
Technology Push vs. Demand Pull

Push vs. Pull

Make all we can just in case.

- Production Approximation
- Anticipated Usage's
- Large Lots
- High Inventories
- Waste
- Management by Firefighting
- Poor Communication

Make what's needed when we need it



- Production Precision
- Actual Consumption
- Small Lots
- Low Inventories
- Waste Reduction
- Management by Sight
